Sensitive Wildlife Areas

The Taku-Teslin-Thompson region contains rich, species- and habitat-rich ecosystems that are highly valued for their scenic beauty and biodiversity. This area has been identified as having significant ecological value due to the presence of a diverse range of wildlife species, including caribou, wolves, and sheep. The region is also important for other biological and ecological processes, such as wetland and riparian habitats, which support a variety of aquatic species.

The Atlin-Taku Planning Area is a sensitive wildlife area due to the presence of a diverse range of wildlife species, including caribou, wolves, and sheep. The region is also important for other biological and ecological processes, such as wetland and riparian habitats, which support a variety of aquatic species.

The Sensitive Wildlife Areas (SWA) are areas that have been identified as having significant ecological value due to the presence of a diverse range of wildlife species, including caribou, wolves, and sheep. The region is also important for other biological and ecological processes, such as wetland and riparian habitats, which support a variety of aquatic species.

The identified areas are those that at least two interviewees identified as supporting Sensitive Wildlife. The areas were selected based on Tlingit and local ecological knowledge of the current extent of the sheep populations within the Yukon Territory. The identified areas are those that at least two interviewees identified as supporting Sensitive Wildlife. The areas were selected based on Tlingit and local ecological knowledge of the current extent of the sheep populations within the Yukon Territory.

The identified areas are those that at least two interviewees identified as supporting Sensitive Wildlife. The areas were selected based on Tlingit and local ecological knowledge of the current extent of the sheep populations within the Yukon Territory.
